

VOC Barrier Testing System for Films

Model GTR-VOC

GTR-VOC has been used for basic study of barrier films with methanol, alcohol and other VOCs in the fields of automotive and chemical.

This system uses differential pressure method to measure permeability of VOC vapors and liquids. It enables to separate the permeate into individual components (qualitative and quantitative analysis). Our new analysis systems have been useful for material science and QC.

- Accurately analyze permeability of VOC liquids.
- Gas chromatography separates the permeate into each components.
- Testing of single and blended liquids possible.
- TCD & FID detection systems ensure accurate and reproducible results.
- Manually operated and fully automated systems available.
- Our unique permeation cells mountable.
- Differential pressure method.
